

My Mini Project

For this module, I created a Unity2D shoot 'em up dogfighting game, where the player controls an F-22 Raptor flying across the map shooting down enemies and earning points. This game is a reflection of both my strengths and weaknesses.

In this project, I tried to simulate realistic 2D jet physics, including acceleration, thrust force, drag force, and more. While it's nowhere near perfect, I pushed to make the movement feel dynamic and engaging. One of the features I'm most proud of would be the camera system, which follows the player with some delay making the game more immersive.

Artillery in this game includes homing missile, exploding bullets both Player and Enemy have both type of attack while the player jet also have healing factor(I added this function for better testing but then I find it balancing the game due to the map being too big), and originally I wanted to experiment with water physics but then I realized it would take sometimes and it's not that necessary so I just dropped It. Aside from the player(Jet) and enemy jets, I also created enemy battleship, with all the sprites drawn by me using pixilart.

With some of my strength listed above, my biggest weakness would be dealing with User Interface (UI) design.

My Direction and Realizations

As someone who identifies as a jack-of-all-trades, master of none, I've realized that securing a specific position in the game industry can be difficult without specialization. However, after doing this project and one of my previous one, I've discovered an interest in 2D pixel art and game design. I'm beginning to see myself more of a creative thinker than someone who enjoys deep analysis or technical systems.

Creativity and My Personal Hobbies

Aside from drawing, I have several hobbies that can support and fuel my creativity. These include dancing, fight choreography, and figure posing—all of which help me find useful references when it comes to designing or illustrating characters and animations. I believe these hobbies give me quite an unique perspective and can be strong assets when it comes to working on visual storytelling or movement-based gameplay.
